Artwork/Project Description:

InStockCook is an iOS cooking assistant app that I worked on with my team as part of the **Apple Developer Academy Foundation Program Batch 4**. The idea came from our own experience as university students living away from home, where we often struggled to decide what to cook with limited ingredients and budget. We wanted to create an app that could **help users find meal ideas based on what they already have while also reducing food waste**. In this project, I worked as a **Hipster (UI/UX Designer) and iOS UI Developer**. I was involved in synthesizing user research, designing the app's flows and interface in Figma based on **Apple's Human Interface Guidelines (HIG)**, and **implementing several UI screens using SwiftUI, particularly the onboarding and ingredient input**. One of our main challenges was allowing users to enter ingredients freely without making the ingredient-matching system too complicated to develop. We addressed this by simplifying the ingredient categories and having regular discussions within the team to keep the design and implementation aligned. We presented the project to mentors during **Demo Day and received positive feedback and encouragement to develop it further**. This project taught me how to connect design decisions with actual implementation while working closely with a cross-functional team under a limited development timeline.

 Website Pitch Deck & Presentation:
[InsightGrader](#)

Artwork/Project Description:

Insight Grader is an **AI-assisted web platform** designed to **streamline assignment evaluation and deliver personalized student feedback**, supporting UN SDG 4 (Quality Education). The idea emerged from our research showing that **teachers spend over 20% of their working hours on manual grading and administrative tasks, leaving minimal capacity to provide the timely, granular feedback that students need to progress**. To address this, we wanted to build a solution that automates routine evaluation while preserving human-centered pedagogical guidance. In this group project, I served as the **Chief Product Officer (CPO) and Hipster (UI/UX Designer)**. I led the product discovery, mapped educators' evaluation journeys, and designed responsive web interfaces in Figma, including an intuitive **4-step grading pipeline (assignment upload, rubric configuration, AI assessment, and score adjustment) alongside class analytics and text-to-voice feedback features**. One of our primary challenges was fostering teacher trust in automated scoring without inducing cognitive friction or fear of AI inaccuracies. We resolved this by implementing a human-in-the-loop UX model with transparent rubric-based breakdowns, inline text annotations, and effortless manual overrides before finalizing grades. We presented Insight Grader at the **ITCentrum Hackathon 2023 and achieved 3rd Place**. This experience taught me how to balance AI automation with human agency in EdTech UX and design transparent, trust-inspiring workflows under tight competition constraints.

[Prototype Figma](#)

Artwork/Project Description:

DiabetSavior is a digital health management app that I worked on with my team for the Google Solution Challenge 2023. The idea came from the challenges we identified in the daily routines of people with diabetes, particularly **remembering medication schedules, monitoring blood glucose, and managing other parts of their treatment routine**. As a **Hipster (UI/UX Designer)**, I worked on mapping the user journey, designing the app flows and interfaces in Figma, and creating a **component-based design system**. I also designed different flows based on the needs of **Type 1 and Type 2 diabetes users** and worked closely with our Flutter developer to make sure the designs could be implemented properly. Our biggest challenge was presenting complex health-related information in a way that was still easy to understand. To address this, we used **step-by-step flows, confirmations for important actions, and clear visual indicators** to help reduce the chance of users misunderstanding the information. The project was successfully **submitted to the Google Solution Challenge 2023**. Through this experience, I learned that designing a digital product, especially one related to healthcare, is not only about creating an appealing interface, but also about making users feel safe, confident, and supported when using it.

HEALTHCARE UX DESIGN SYSTEM • DUAL TAILORED WORKFLOWS (SDG 3)

Artwork/Project Description:

Informatics Expo is one of the main events organized by the Informatics Study Program at UII, held every semester to showcase students' semester-long **capstone projects**. I had the opportunity to serve as the **Person in Charge (PIC) three time**, twice at Sleman City Hall (SCH) and most recently at Pakuwon Mall Yogyakarta, which became the biggest expo we organized. Being a PIC three times gave me the opportunity to see and contribute to the growth of the event from one expo to the next. I learned from what did not work well in previous events and used those experiences to improve the following ones. I coordinated with more than **30 committee members** across different divisions, helped align academic, technical, and event needs, and worked with the team to address various challenges during both preparation and execution. To keep the coordination on track, I also introduced **daily sprint meetings** and structured Minutes of Meeting (MoM) so that each team had a clearer view of their progress and responsibilities. For me, this experience was not only about organizing an event, but also about learning **to take ownership, communicate with different people, and stay calm when things do not go as planned**. From my first expo to the final event at Pakuwon Mall, I became more confident in making decisions, communicating directions, and adapting to changing situations. Serving as a PIC three times also taught me that previous experiences can become valuable lessons for **making the next one better**.
